

BAB V

KESIMPULAN DAN SARAN

5.1 Kesimpulan

Berdasarkan analisis dari hasil perancangan dan simulasi pada model baterai didapatkan kesimpulan sebagai berikut:

1. Performa baterai dipengaruhi beberapa faktor, salah satunya adalah suhu, yang mana suhu merupakan komponen yang dapat diatur/dijaga supaya performa baterai tetap terjaga.
2. Hubungan perbedaan suhu baterai pada *battery pack* dengan SoC baterai lebih berpengaruh ketika baterai dipasang secara seri. Perbedaan SoC antara baterai yang memiliki suhu tinggi dengan suhu rendah dapat mencapai 6,9% ketika perbedaan suhu mencapai 10 °C.
3. Perbedaan suhu pada koneksi baterai secara paralel tidak mempengaruhi secara signifikan pada SoC baterai. Hal ini dikarenakan baterai dengan suhu lebih tinggi akan menyuplai arus lebih tinggi dari pada baterai dengan suhu yang lebih rendah.

5.2 Saran

Saran untuk pengembangan penelitian dan peneliti selanjutnya adalah:

1. Pengembangan model termal baterai yang lebih kompleks agar dapat merepresentasikan kenaikan suhu lebih presisi.
2. Pemodelan pengaruh suhu terhadap kondisi pada hubungan seri dan paralel baterai dapat dibuat suhu dalam kondisi tidak stagnan.
3. Penambahan komponen sifat dinamis baterai untuk melihat sifat dinamis baterai.
