

ABSTRACT

Grogol Tourism Village is committed to maintaining the quality of the tourist environment, one of which is by providing standard-compliant sanitation facilities for tourists. Therefore, this research conducted in the outbound area of the Grogol Tourism Village aims to determine the condition of the four basic sanitation facilities in the area through an assessment. Furthermore, it can be a suggestion for improvement or development for managers to maintain a clean and healthy tourist environment free from disease nests. This study uses an assessment form that is compiled based on several reference sources. The assessment form was filled out by researchers through four times direct observation and by 19 tourists through non-interactive qualitative surveys using questionnaires. The data is presented in the form of scoring which is then classified into five lists of predicates. The results showed that toilet facilities had a good predicate with an average score of 79 (79%), clean water supply facilities had a very good predicate with a score of 81 (81%), facilities for storage and management of waste received a good predicate with score of 50 (50%), and wastewater disposal facilities with a score of 89 (89%) had a very good predicate. Based on the results of the assessment, it is known that the indicators that have not been met can then be improved and developed by the manager of the Grogol Tourism Village.

Keywords: Grogol Tourism Village, outbound, assessment, sanitation facilities, environmental health.

INTISARI

Desa Wisata Grogol memiliki komitmen dalam menjaga kualitas lingkungan wisata salah satunya dengan memberikan fasilitas sanitasi yang sesuai standar untuk wisatawan. Oleh karena itu, penelitian yang dilakukan di area *outbound* Desa Wisata Grogol ini bertujuan untuk mengetahui kondisi empat sarana sanitasi dasar di area tersebut melalui penilaian. Selanjutnya, dapat menjadi saran perbaikan atau pengembangan untuk pengelola demi menjaga lingkungan wisata yang bersih dan sehat bebas dari sarang penyakit. Penelitian ini menggunakan *assessment form* yang disusun berdasarkan beberapa sumber referensi. *Assessment form* diisi oleh peneliti melalui observasi langsung selama empat kali dan oleh 19 wisatawan melalui survei kualitatif non-interaktif menggunakan kuesioner. Data disajikan dalam bentuk *scoring* yang kemudian digolongkan ke dalam lima daftar predikat. Hasil penelitian menunjukkan sarana toilet berpredikat baik dengan nilai rata-rata 79 (79%), sarana penyediaan air bersih berpredikat sangat baik dengan nilai 81 (81%), sarana penampungan dan pengelolaan sampah mendapat nilai 50 (50%) berpredikat baik, dan sarana pembuangan air limbah mendapat nilai 89 (89%) berpredikat sangat baik. Berdasarkan hasil penilaian tersebut, diketahui indikator yang belum terpenuhi untuk selanjutnya dapat dilakukan perbaikan dan pengembangan oleh pengelola Desa Wisata Grogol.
