Kata Kunci: Kekerasan anak, gambaran luka, distribusi luka, jumlah kekerasan

ABSTRACT

Background: Child abuse is a public health, human rights, and social problem, with potentially devastating and detrimental consequences. Its destructive impact harms children in every country, impacts families, communities, and nations, and reaches across generations. According to WHO, 1 in 2 children in the world experience violence every year. Violence is classified into physical violence, psychological violence, and sexual violence. Violence against children can have negative impacts on children, such as injury, death, and even anxiety/mental disorders in the long term. The wounds caused have characteristics based on the trauma inflicted, namely trauma from sharp or blunt objects. Objective: to find out the number of incidents of victims of violence against children in the Kebayoran Lama Health Center in 2018 - 2022 and to find out the distribution based on year, age, gender, location, and type of violence

Methods: This research is quantitative research with a descriptive observational method with a cross sectional study design. The research subjects were child victims of violence who were examined at the Kebayoran Lama Health Center in 2018 - 2022 whose data was available in the Kebayoran Lama Health Center medical records.

Objective: to determine the number of incidents of victims of violence against children at the Kebayoran Lama Community Health Center in 2018 - 2022 and to understand the description and distribution based on year, age, gender, location and type of violence

Result: The results of the research found that the number of violence against children from 2018 - 2022 was 119 cases. The largest age group was children aged 11 - 18 years with a total of 44 cases (38%). The most common Gender was male. The most common locations for woundswere in the chest and abdomen, 31 (25%). The most common wound descriptions were blunt injuries/bruises, 79 cases (66.38%)

Conclusion: Victims of violence against children in this study were mostly found at the age of 11 - 18 years or in productive age/adolescence, cases of blunt force violence with the highest locations were in the chest and stomach.
