Referensi software :

The **Mathcad Treasury of Statistics, Volume I: Hypothesis Testing**, written by Mathcad expert Paul R. Lorczaak, offers you electronic access to statistical methods and formulas which you use regularly.

The **Treasury of Statistics** series uses **Mathcad** to teach and explain widely used statistical function and demonstrates how to combine **Mathcad** features to solve a range of problem. Volume I focuses on hypothesis testing. The book contains general discussions of many of the most commonly used parametric and non-parametric hypothesis test, highlights the test assumptions and discusses potential pitfalls.

The **Mathcad Treasury of Statistics, Volume II: Data Analysis** was written by Donna M. DiFranco, Ph.D., an instructor and consultant in field of statistical analysis. The **Treasury of Statistics** series uses **Mathcad** to teach and explain widely used statistical methods and demonstrates how to combine **Mathcad** features to solve a range of problems. Volume II of the series addresses the topics of data analysis. It contains descriptions and **Mathcad** implementations of many analytical tolls as well as offers guidelines in their use, a clear description of the assumptions involved, and methods by which theses assumption may be verified.

Volume II contains a set of twelve new functions which are useful in performing data analysis with **Mathcad**. Each functions is documented with an example in the Electronic Book. Once installed, the new functions become part of **Mathcad**'s built-in function set and can be used to compute values and plot results independent of the book. The new functions include sample variance and standard deviation functions; Student's, chi-square, F, normal, binominal and Poison cumulative distribution functions; exponential and moving average smoothing functions; a linear trend removal function and a Gaussian vector generator.

The **Topics in Mathcad: Statistics** Electronic Book contains selected topics from the very popular *Statistics I: Tests and Estimation* and *Statistics II: Modeling and Simulation* Applications Packs, as well as eight new worksheets on selected statistical topics. This new Electronic Book is part of a series of Electronic Books that provide the **Mathcad** user with general-purpose tools that illustrate a variate a variety of useful **Mathcad** techniques.

The **Statistics** electronic Book contains 20 complete "live" worksheet that provide many standard algorithms effective for a broad range of statistical problems such as estimating the mean of a normal populations, calculating operating characteristic curves of simulating multinomial experiments. The applications in this Electronic Book implement common statistical testing, estimation, statistical modeling and simulations techniques. New worksheets included in this Electronic Book include random Deviates, Principal Component Analysis, Sampling With and Without Replacement, 2D Prediction, Cluster Analysis, Sample Plans, Monte-Carlo Techniques and Time Series: Smoothing and Prediction. Clearly and concisely
