Kucing merupakan hewan yang banyak dipelihara manusia. Hampir semua ras kucing dapat terinfeksi penyakit, salah satunya rinithis. Penelitian ini bertujuan untuk mengkaji kejadian penyakit rinithis berdasarkan gejala klinis berupa leleran hidung, batuk atau bersin, dan pembengkakan limfoglandula. Sebanyak 50 pasien kucing dengan jumlah gejala rinithis sebanyak 65 gejala. Data tersebut dikelompokkan berdasarkan gejala klinis yang tampak, meliputi leleran hidung, batuk atau bersin, dan pembengkakan limfoglandula. Data kemudian ditabulasi dalam bentuk table frekuensi distribusi dan dilakukan analisa secara deskriptif. Hasil penelitian ini. Hasil penelitian ini menunjukkan kucing dengan gejala batuk bersin sebanyak 28 ekor, dengan gejala leleran hidung sebanyak 33 ekor, dan gejala limfonodus bengkak sebanyak 4 ekor. Berdasarkan penelitian ini dapat disimpulkan bahwa gejala yang sering muncul yaitu batuk bersin dan leleran hidung.

Cats are the most common pet animal. Almost all breeds of cats can be infected with diseases, one of which is rithith. This study aims to examine the incidence of rhinitis based on clinical symptoms such as nasal discharge, coughing or sneezing, and swelling of lymphoglandula. A total of 50 cat patients with a total of 65 symptoms of rhinithis. These data are grouped based on clinical symptoms that appear, including runny nose, coughing or sneezing, and swelling of lymphoglandula. Data then tabulated in the form of frequency distribution table and analyzed descriptively. The results of this study. The results of this study showed that cats with symptoms of coughing as many as 28 tails, with symptoms of running nose as much as 33 tails, and symptoms of swollen lymph nodes as much as 4 tails. Based on this study it can be concluded that the symptoms that often appear are sneezing and nasal coughing.
