

INTISARI

Diabetes Melitus (DM) merupakan salah satu masalah kesehatan masyarakat yang penting dan masuk dalam empat penyakit *noncommunicable diseases* (NCDs). Sebagian besar penderita DM belum memahami secara benar pengobatan yang dijalannya. Ketidakpatuhan dan ketidakpahaman pasien dalam menjalankan terapi merupakan salah satu penyebab kegagalan terapi. Penelitian ini bertujuan untuk melihat pengaruh *Medication Therapy Management* (MTM) terhadap tingkat kepatuhan, *outcome* klinik dan kualitas hidup pasien DM peserta Program Rujuk Balik (PRB).

Rancangan penelitian ini menggunakan kuasi-ekperimental, dengan desain penelitian *pretest-posttest with control group*. Bentuk intervensi berupa layanan farmasi berbasis MTM. Subjek penelitian yaitu pasien DM peserta PRB di Kabupaten Sragen yang masuk kriteria inklusi. Instrumen yang digunakan berupa *pill count*, pengukuran GDP dan DQLCTQ. Analisis data menggunakan uji *Mann-whitney* atau *T-Test*.

Dari total 106 responden terbagi menjadi dua yaitu 55 responden kelompok kontrol dan 51 responden kelompok intervensi. Setelah dilakukan intervensi berupa layanan farmasi berbasis MTM menunjukkan peningkatan kepatuhan pasien sebesar $5,76 \pm 9,17$ ($p=0,01$), peningkatan *outcome* klinik berupa penurunan GDP sebesar $26,61 \pm 42,04$ ($p=0,010$), dan peningkatan kualitas hidup pasien sebesar $2,71 \pm 4,83$ ($p=0,018$). Intervensi berupa layanan farmasi berbasis MTM dalam penelitian ini memperbaiki semua aspek variabel yang diteliti.

ABSTRACT

Diabetes Mellitus (DM) is an important public health problem and is included in four non-communicable diseases (NCDs). Most of DM sufferers do not understand correctly the treatment they are undergoing. Non-compliance and patient lack of understanding in carrying out therapy is one of the causes of therapy failure. This study aims to determine the effect of Medication Therapy Management (MTM) on the level of adherence, clinical outcomes and quality of life for DM patients of referral-drug programme participants.

The design of the study used a quasi-experimental, with research design pretest-posttest with control group. The form of intervention is MTM-based pharmacy services. The research subjects were DM patients of referral-drug programme participants in Sragen Regency, who entered inclusion criteria. The instruments that used were pill count, GDP measurement and DQLCTQ. The effect of MTM was analyzed using Mann-whitney test or T-test.

Of the total 106 respondents divided into two, 55 into control groups and 51 into intervention groups. After the intervention of MTM-based pharmacy services shows that the intervention group has a better value than the control group. In the intervention group, there was an increase in patient compliance by 5.76 ± 9.17 ($p=0.001$), an increase in clinical outcomes as decrease in GDP by 26.61 ± 42.04 ($p=0.010$), and the patient's quality of life increased by 2.71 ± 4.83 ($p=0.018$). MTM interventions in this study improved all aspects of the variables examined.
