**INTISARI**

Telah disintesis dan diuji senyawa nitrovanilin azina (**NA**) sebagai kemosensor kolorimetri anion berbahan dasar vanilin. Senyawa **NA** diperoleh melalui dua tahap reaksi. Vanilin dinitrasi menghasilkan 5-nitrovanilin (5-NV) dan dilanjutkan kondensasi *Schiff base* dengan hidrazin hidrat. Semua produk hasil sintesis dielusidasikan menggunakan FT-IR, GC-MS, DI-MS, <sup>1</sup>H-NMR, dan <sup>13</sup>C-NMR. Uji aktivitas sebagai kemosensor kolorimetri dilakukan terhadap anion yaitu F<sup>-</sup>, Cl<sup>-</sup>, Br<sup>-</sup>, I<sup>-</sup>, S<sup>2-</sup>, CN<sup>-</sup>, AcO<sup>-</sup>, HCO<sub>3</sub><sup>-</sup>, H<sub>2</sub>PO<sub>4</sub><sup>-</sup>, N<sub>3</sub><sup>-</sup>, NO<sub>2</sub><sup>-</sup>, SCN<sup>-</sup>, ClO<sub>3</sub><sup>-</sup>, dan NO<sub>3</sub><sup>-</sup>.

Hasil reaksi nitrasi terhadap vanilin dengan asam nitrat diperoleh rendemen sebesar 71,72%, sedang nitrovanilin azina (**NA**) diperoleh dengan randemen sebesar 76,41%. Pendektsian anion ditentukan berdasarkan studi spektrofotometer UV-Vis dan pengamatan secara mata telanjang. Hasil uji ionokromik sebagai sensor anion menunjukkan bahwa kemosensor **NA** hanya selektif terhadap anion sulfida (S<sup>2-</sup>) dalam pelarut DMF:HBS (9:1, v/v, 10 mM, pH = 7,4) dari warna kuning muda menjadi hijau tua. Nilai limit deteksi (LOD) sulfida secara kolorimetri diperoleh sebesar  $1,43 \times 10^{-5}$  M (14,3  $\mu$ M), sedangkan model interaksi *host-guest* (**NA-S<sup>2-</sup>**) yang terjadi melalui deprotonasi pada gugus -OH dengan rasio 1:1.

**SYNTHESIS OF NITROVANILLIN AZINE DERIVATIVE FROM  
VANILLIN AS COLORIMETRIC CHEMOSENSOR FOR THE  
DETECTION OF SULFIDE ANION**

**Diana Lestari**

**ABSTRACT**

The compound nitrovanillin azine (**NA**) has been synthesized and tested as an anion colorimetric chemosensor based on vanillin. The **NA** compound was obtained through a two-step reaction. Vanillin was nitrated to yield 5-nitrovanillin (5-NV) and followed by condensation of *Schiff base* reaction with hydrazine hydrate. All synthesized products were elucidated using FT-IR, GC-MS, DI-MS, <sup>1</sup>H-NMR, and <sup>13</sup>C-NMR. Activity tests as colorimetric sensors were carried out on the anions, i.e., F<sup>-</sup>, Cl<sup>-</sup>, Br<sup>-</sup>, I<sup>-</sup>, S<sup>2-</sup>, CN<sup>-</sup>, AcO<sup>-</sup>, HCO<sub>3</sub><sup>-</sup>, H<sub>2</sub>PO<sub>4</sub><sup>-</sup>, N<sub>3</sub><sup>-</sup>, NO<sub>2</sub><sup>-</sup>, SCN<sup>-</sup>, ClO<sub>3</sub><sup>-</sup>, and NO<sub>3</sub><sup>-</sup>.

The nitration of vanillin using nitric acid was obtained in 71.72% yield, while nitrovanillin azine (**NA**) was yielded in 76.41%. The anions detection were determined based on UV-Vis spectrophotometer studies and observations with the naked eyes. The results of the ionochromic test as an anion sensor showed that chemosensor **NA** was only selective for sulfide anion (S<sup>2-</sup>) in DMF:HBS (9:1, v/v, 10 mM, pH = 7.4) from light yellow to dark green. The detection of limit value (LOD) is obtained by colorimetric at a concentration of 1.43×10<sup>-5</sup> M (14.3 μM), while the host-guest interaction model (**NA-S<sup>2-</sup>**) occurs through deprotonation of the -OH group with a ratio of 1:1.
